STOWAGE PLAN

CARGOSAFETY.COM.BR

STOWAGE PLAN

The Stowage Plan, or Cargo Stowage Plan, is the technical document that defines the arrangement and positioning of cargoes on board a vessel, whether it be a ship or a transport unit (containers). Its purpose is to ensure structural balance, cargo stability, and space optimization for loading and unloading operations. This plan is prepared by logistics and naval engineering professionals, taking into account the type of cargo, the individual ship, and the port of departure and destination, as well as the specific operating conditions required for each stage of the operation.

The plan is developed in accordance with the standards and international conventions of the International Maritime Organization (IMO) — including SOLAS (Safety of Life at Sea) and the Cargo Securing Manual (CSS Code) — and the directives of the International Convention for Safe Containers (CSC), in addition to technical standards from ISO, ABNT (NBR 5841, NBR 13230) and classification societies such as DNV, ABS, and Lloyd's Register.

The Stowage Plan is prepared by qualified professionals, such as Chief Officers, Captains, or Port Captains in Marine Warranty Surveyor operations, and serves to ensure the safe operation of the ship, the correct distribution of cargo weights and volumes, and to prevent individual accidents or damage to the ship and the means of transport.

For the client, this service represents the operational and cargo asset security, reducing the risk of accidents and ensuring compliance with safety and structural integrity standards. When attached to the Stowage Plan, logistics operators and transporters can ensure that the cargo operations are planned in accordance with the best safety and engineering practices applied to the transportation of heavy and industrial project cargoes.
